

What you should know about:

Homotoxicology and BioMeridian™

Homotoxicology

Homotoxicology is a branch of medicine used widely around the world, and it is now experiencing significant growth in the United States. It has two foundational beliefs that differ slightly from the traditional allopathic medicine. Homotoxicology is the belief that:

- Most illness comes from invasion of the body by foreign toxins (e.g. bacteria, virus, chemical pollutants, heavy-metal toxins, etc.), which require special treatment protocols to rid the body of them.
- Treatment protocols should be designed to address the original cause of the illness rather than just the symptoms. Some would say that homotoxicology works toward a “permanent cure” for illness.

Typically, treatment protocols in homotoxicology include primarily natural remedies that deliver fewer and less severe side effects when compared to pharmaceutical drugs. Homotoxicology is strongly recommended for those patients who have not responded well to traditional pharmaceutical drug protocols or who want to rely on more natural remedies.

Our BioMeridian computerized instrument with MSA-21 technology tests the health of individual meridians and the organs they are “wired” to. This technology helps us judge whether individual systems are functioning properly. The data from this test provides general, overall information about the function of different body parts. The data can help us better understand your state of health and diagnose disease for further treatment.

This testing procedure can also help us understand whether your health is being affected by sensitivities to a wider range of substances from food to environmental substances.
